

# Music and Media

## 4 October 2004

### Lecture 4

Hello class!

Our lecture today covers the following:

- Exporting songs, project files, source files
- Differences between CD Audio, CD Data
- Presentation of Homework 1
- Questions (email [ochsa@solscope.com](mailto:ochsa@solscope.com))

### Homework 1 Continued

First off, all the required software as well as sample files will always be available on our class website at: <http://www.solscope.com/~ochsa/>.

The assignment for this section of the class was:

- Understand how an audio editor is laid out and what the displays represent.
- Learn functions for cutting, copying, and pasting portions of audio.
- Experiment with various functions to change the sound quality (bass boost, normalization, noise removal).
- Create a new audio file by combining portions of the two sample files with the functions you have learned to use,

Those of you who have your homework complete will present your work in class. You will be expected to show what functions you applied, what portions of the source files you used, and what you discovered with the program in editing your work.

If you haven't been able to get Audacity working, the audio files loading, or have difficulty saving, copying, and/or moving files, we'll cover the basics for both PC and Mac in class today.

Our next class will wrap up this section on audio editing basics, and begin introducing sample sets and multitrack editing!
